| Scope            | Version 1 only                                                            |

Prepared for wireframe review and structural approval

# 01 Project Overview

What SevaNest is designed to solve

## Product Summary

SevaNest is a household workforce marketplace connecting customers with verified maids, drivers, cooks, babysitters, elderly-care helpers and cleaning helpers. The V1 experience is designed around discovering suitable workers, arranging an interview or trial, confirming a booking, completing payment, managing the ongoing service, and supporting replacement or complaints when required.

## Primary Business Loop

| Customer                                     | Worker                                          | Admin                                      |
|----------------------------------------------|-------------------------------------------------|--------------------------------------------|
| Find and hire household staff                | Find and manage job opportunities               | Operate and control the marketplace        |
| Profile, requirement, search, shortlist      | Profile, KYC, availability and preferences      | Verification, matching and operations      |
| Interview/trial → booking → payment          | Accept/decline → interview/trial → confirmation | Bookings → payments → support/replacement  |
| Ongoing service → rating/replacement/support | Current work → attendance/status → support      | Reports → configuration → audit visibility |

## V1 Boundaries

- In scope: OTP authentication, profiles, service categories, location/availability filtering, KYC, search/matching, interview/trial, booking, payment, attendance/status, ratings, replacement, support, notifications, dashboards/reports and role-based Admin.
- Out of V1: automated payroll/statutory payroll compliance, worker loans/credit, insurance marketplace, facial-recognition attendance, complex AI recommendation engine, full apartment ERP, advanced corporate workforce module and multi-country operations.
- Future roadmap items are not treated as V1 wireframe requirements.

## 02 Purpose & V1 Scope

What the wireframes are intended to validate

### Wireframe Objective

The wireframes are intended to validate information architecture, screen hierarchy, navigation, key actions and end-to-end business flows before high-fidelity visual design and implementation.

### Critical User Flows

| Flow     | Journey                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Customer | OTP → Profile → Service → Engagement → Requirement → Location → Worker Results → Worker Profile → Shortlist / Interview / Trial → Confirm → Payment → Booking → Ongoing Service → Rating / Replacement / Support |
| Worker   | OTP → Onboarding → KYC → Verification → Job Opportunity → Accept / Decline → Interview / Trial → Job Confirmation → Current Work → Attendance / Status → Support                                                 |
| Admin    | Login → Dashboard → Verification / Matching → Interview / Trial → Booking → Payment / Support / Replacement → Reports → Configuration                                                                            |

### Design Principle

The wireframes remain intentionally structural. They should communicate what the user sees, what the user can do, and where each action leads without turning the document into a final visual design specification.

## 03 Product Ecosystem & Interactive Prototypes

Three products, one connected service experience

### Product Structure

| Product      | Platform      | Primary role                                                                           |
|--------------|---------------|----------------------------------------------------------------------------------------|
| Customer App | Android / iOS | Discover, evaluate, book and manage household workforce                                |
| Worker App   | Android / iOS | Onboard, complete KYC, receive opportunities and manage current work                   |
| Admin Portal | Web           | Operate verification, matching, bookings, payments, support, reports and configuration |

### Interactive Wireframe Prototypes

The following published Figma Sites are the interactive wireframe references supplied for this project. They can be used during review to validate screen structure, navigation and flow.

| Product             | Interactive Prototype                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------|
| Customer Mobile App | <a href="https://knee-sign-82168614.figma.site">https://knee-sign-82168614.figma.site</a>       |
| Worker Mobile App   | <a href="https://patch-factor-63499758.figma.site">https://patch-factor-63499758.figma.site</a> |
| Admin Web Portal    | <a href="https://number-hash-30005800.figma.site">https://number-hash-30005800.figma.site</a>   |

**Review focus:** navigation, user journeys, information hierarchy, primary actions, states and overall workflow completeness.

**Prototype note:** These are low-fidelity structural references; final colors, typography, imagery and detailed visual polish are handled in the high-fidelity UI phase.

## 04 Customer Mobile — Primary Journey

Customer path from sign-in to ongoing service

| Stage                    | Key screens / actions                                                               |
|--------------------------|-------------------------------------------------------------------------------------|
| 1. Access                | Login → OTP verification                                                            |
| 2. Setup                 | Profile → saved address → basic verification where required                         |
| 3. Requirement           | Home → service category → engagement type → service requirements → location         |
| 4. Discovery             | Search results → filters → worker profile                                           |
| 5. Evaluation            | Shortlist → interview request / trial request → status                              |
| 6. Confirmation          | Confirm worker → booking summary → payment → payment result → booking confirmation  |
| 7. Service               | Booking status → active service → attendance / service status → service history     |
| 8. After-service support | Rate worker → replacement request/status → support request/status → payment history |

### Customer UX Priorities

- Make the next action obvious at every step.
- Keep worker comparison information easy to scan before an interview, trial or confirmation.
- Clearly distinguish payment processing, success and failure states.
- Provide visible booking and service status after confirmation.
- Keep replacement and support accessible without disrupting the main booking flow.

**Interactive prototype:** [Open Customer Mobile Wireframe](#)

## 05 Customer Mobile — Wireframe Set

### Core V1 screen groups

| Group                    | Representative screens                                                                                                                                             |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication & profile | Login, OTP Verification, Profile Setup, Saved Addresses, Add Address, Basic Verification                                                                           |
| Discovery                | Home, Service Category, Engagement Type, Service Requirements, Location, Search Results, Filters                                                                   |
| Worker evaluation        | Worker Profile, Favourites / Shortlist, Interview Request, Trial Request, Interview / Trial Status                                                                 |
| Booking & payment        | Confirm Worker, Booking Summary, Payment, Payment Processing, Payment Success, Payment Failure, Booking Confirmation                                               |
| Service management       | Booking Status Timeline, Active Service, Attendance / Service Status, Service History, Bookings, Booking Detail                                                    |
| Post-service             | Rate Worker, Replacement Request, Replacement Status, Replacement Worker Results, Select Replacement, Replacement Confirmation                                     |
| Support & account        | Support, Create Support Request, Support Status, Payments / Transactions, Payment Receipt, Refund Status, Customer Profile, Edit Profile, Saved Address Management |

The wireframe set is derived from the V1 screen inventory and focuses the clickable prototype on the critical customer journey rather than future roadmap features.

## 06 Worker Mobile — Primary Journey

Simple, low-friction workforce experience

| Stage                | Key screens / actions                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Access            | Login → OTP verification                                                                                                                                               |
| 2. Onboarding        | Photo → personal details → previous employment/reference → role → experience → languages → preferred locations → expected salary → available timings → work preference |
| 3. Verification      | KYC document upload → verification status                                                                                                                              |
| 4. Opportunities     | Worker home → job opportunities → opportunity detail → accept / decline                                                                                                |
| 5. Selection         | Interview / trial schedule → job confirmation                                                                                                                          |
| 6. Current work      | Current work → attendance / status → payment reference → ratings                                                                                                       |
| 7. Support & profile | Support → create request → support status → worker profile → edit profile → skills → availability → work preferences                                                   |

### Worker UX Priorities

- Use large touch targets and short, understandable onboarding steps.
- Keep status labels and actions simple and consistent.
- Support local-language readiness in content architecture.
- Protect KYC and identity information; documents should not be publicly exposed.
- Make job acceptance/decline and current-work status easy to understand.

**Interactive prototype:** [Open Worker Mobile Wireframe](#)

# 07 Worker Mobile — Wireframe Set

Core V1 screen groups

| Group                       | Representative screens                                                                                          |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------|
| Authentication & onboarding | Login, OTP Verification, Profile Photo, Personal Details, Previous Employment / Reference                       |
| Worker profile setup        | Role Selection, Experience, Languages, Preferred Locations, Expected Salary, Available Timings, Work Preference |
| KYC & verification          | KYC Document Upload, Verification Status                                                                        |
| Jobs                        | Worker Home, Job Opportunities, Job Opportunity Detail, Interview / Trial Schedule, Job Confirmation            |
| Current work                | Current Work, Attendance / Status, Earnings / Payment Reference, Ratings                                        |
| Support                     | Support, Create Support Request, Support Status                                                                 |
| Profile management          | Worker Profile, Edit Profile, Skills, Availability, Work Preferences                                            |

The worker experience prioritizes clarity and low cognitive load because the product must work for users with different levels of digital familiarity.

## 08 Admin Web — Operational Journey

Marketplace control and operational visibility

| Stage                     | Admin responsibilities                                                                           |
|---------------------------|--------------------------------------------------------------------------------------------------|
| 1. Access                 | Protected Admin login                                                                            |
| 2. Overview               | Dashboard with operational metrics and attention areas                                           |
| 3. People                 | Customers and Workers management                                                                 |
| 4. Verification           | KYC queue → secure document review → approve / reject / re-review with remarks and audit context |
| 5. Marketplace operations | Bookings → worker matching → interview / trial → booking confirmation and status management      |
| 6. Finance                | Payment status, payment detail, refund/reference visibility                                      |
| 7. Support & replacement  | Support tickets, assignment/escalation/resolution, replacement-related operations                |
| 8. Reporting              | Bookings, conversion, category demand, location demand and worker utilization                    |
| 9. Configuration          | Categories, areas, fees, plans, notification templates, roles and audit logs                     |

**Interactive prototype:** [Open Admin Web Wireframe](#)

## 09 Admin Web — Wireframe Set

Core V1 module coverage

| Module        | Core wireframe coverage                                                                      |
|---------------|----------------------------------------------------------------------------------------------|
| Dashboard     | Bookings, active workers, pending KYC, complaints, replacements, collections                 |
| Customers     | Customer list, customer detail, status, bookings, history, complaints and notes              |
| Workers       | Worker list, worker detail, skills, availability, rating, verification, documents and status |
| Verification  | Verification queue and secure verification detail                                            |
| Bookings      | Bookings list/detail, worker matching, interview/trial workflow                              |
| Payments      | Payment list/detail, transaction status, fee records, refunds, invoice/reference visibility  |
| Support       | Support tickets, ticket detail, assignment/escalation/resolution workflow                    |
| Reports       | Bookings, conversion, category demand, location demand and worker utilization                |
| Configuration | Categories, areas, fees, plans, notification templates, roles and audit logs                 |

Exact permission matrices, support SLAs, fee values and authentication method remain implementation decisions where the source requirements do not define them.

# 10 Cross-Product Rules & States

Consistency and operational safety

## Required Interaction States

| Area                  | States / rules                                                            |
|-----------------------|---------------------------------------------------------------------------|
| Data loading          | Skeleton or spinner; prevent confusing duplicate actions                  |
| Empty                 | Clear explanation plus one relevant next action                           |
| Error                 | Human-readable message plus retry/back action where appropriate           |
| Success               | Clear confirmation and logical next step                                  |
| Payments              | Processing, success and failure must be distinct                          |
| KYC                   | Upload, review, status and restricted document access                     |
| Critical actions      | Confirmation before verification decisions or other consequential changes |
| Tables/lists          | Search, filtering and pagination where applicable                         |
| Sensitive information | Identity documents and restricted data must not be publicly exposed       |
| Auditability          | Critical Admin actions should have audit visibility                       |

## Shared Component Patterns

Primary/secondary/destructive/disabled/loading buttons; inputs; filters; status badges; cards; tables; confirmation modals; toasts; upload cards; timelines; bottom navigation; empty states; error states; loading states.

# 11 Wireframe Structure & Prototype Plan

How the wireframes should be reviewed

## Recommended Figma Organization

| Page                   | Purpose                                                    |
|------------------------|------------------------------------------------------------|
| 00 Cover & Flow Map    | Project overview and cross-product journey map             |
| 01 Foundations         | Wireframe conventions, component rules and shared patterns |
| 02 Admin Wireframes    | Admin screens and operational flows                        |
| 03 Worker Wireframes   | Worker onboarding, jobs and current-work flows             |
| 04 Customer Wireframes | Customer discovery, booking and service flows              |
| 05 Prototype Map       | Clickable navigation and flow relationships                |
| 06 States & Components | Shared states and reusable interaction patterns            |

## Construction Principles

- Use reusable components and Auto Layout.
- Use consistent frame naming/IDs for traceability.
- Keep mobile frames optimized for touch interaction; use larger worker touch targets.
- Use neutral placeholders where the requirements do not define exact values.
- Do not use real identity or payment information in the prototype.
- Keep low-fidelity structure separate from final visual polish.

## Prototype QA

Before approval, the clickable prototype should be checked for complete customer discovery/booking/payment/service flows, worker onboarding/KYC/job/current-work flows, Admin operational flows, and all important loading, empty, error and confirmation states.

# 12 Review Items, Assumptions & Next Step

Items to confirm before high-fidelity design

## Client Review Checklist

- Confirm that the three product journeys reflect the intended V1 business process.
- Confirm screen hierarchy and navigation before visual design begins.
- Confirm the placement and wording of major CTAs.
- Confirm that interview/trial, booking, payment, replacement and support flows match the intended operations.
- Confirm Admin operational modules and reporting expectations.
- Confirm whether any V1-required workflow is missing from the clickable prototypes.

## Open / Undefined Items

- Exact payment fee values and pricing rules are not defined in the source requirements.
- Exact backend status enums are not defined.
- Complete Admin permission matrix is not defined.
- Exact Admin authentication mechanism is not specified.
- Support categories and SLA values are not fully specified.
- Where these items are undefined, the wireframes should use neutral placeholders rather than invented production values.

## Next Step

After structural review and approval of the wireframes, proceed to high-fidelity UI design, design-system definition, responsive detailing and final prototype refinement.

**Interactive prototype links are included in Section 3 and repeated within the relevant product sections for quick client access.**
